

previews of your videos ...easy with our video module

Ever downloaded videos for hours only to find out that their content was not what you expected?

Are you looking for ways to offer clients and coworkers previews without having to deal with different kinds of formats, codes and other conversion parameters?

We've got the Solution.

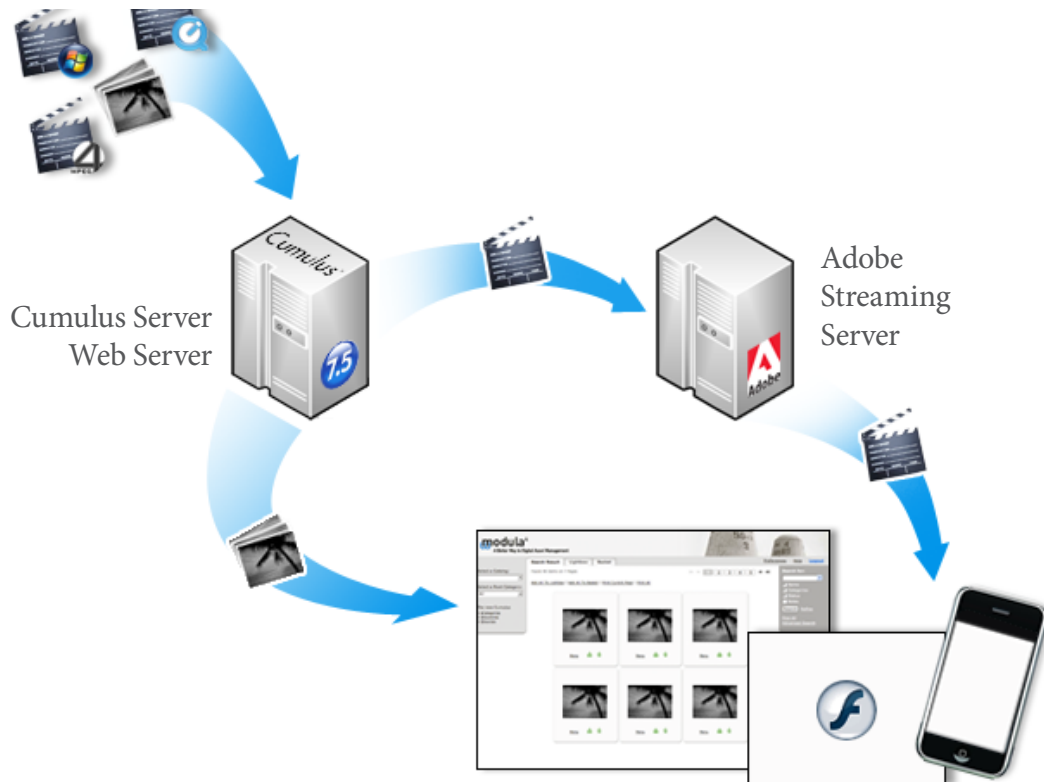

Using our Video Module you can present videos on the Internet in an easy and secure fashion. Previews in form of video streams offer your clients a way to watch videos in full length without extensive download times. And they can also skip back and forth in the video and so get an idea of what the movie is like. Our module converts your video files for the Adobe Flash Streaming Server. This is done automatically as soon as a new file is placed in Cumulus. Subsequently the converted file is – again automatically – stored on a Streaming Server from where it is made available to clients for download. Of course all standard formats are supported (AVI, MPEG2, QuickTime, etc.). We can accommodate special formats by customizing accordingly.

The license for the Adobe Flash Streaming Server is included in the price. Conversion happens asynchronously and on the server side.

The capacity of your desktop is, therefore, not compromised. If you want to convert several videos at once, you can distribute the task among several different servers. As you can see, our module scales well.

You can decide ahead of time whether files are released to clients right after being posted or only after the conversion is completed and the video streams provided.

Also you can create different previews for various kinds of bandwidths (DSL, ISDN, etc.). That way clients, coworkers or contractors always have their own specific and ideal version at the ready. Here too, we stress flexibility.

Our module is compatible with the Canto Video Suite. That way you can combine the advantages of Video Suite with those of our module. Doing so makes it possible to access individual scenes as video streams on the Internet.

As is the case with all our modules, we also offer additional, optional functions and adjustments for the Video Module. For example, we developed a solution for a client from the film industry that allows clients to optimize the process of examining movies. We did so by adding a function for forwarding and commenting on previews, even for individual scenes.

Another client who sells movies on the Internet received our Video Module combined with our eCommerce solution. That way, clients of our clients can watch previews and see the quality of the movies before they purchase them.
